Welcome to the CoGrammar Datasets and DataFrames

The session will start shortly...

Questions? Drop them in the chat. We'll have dedicated moderators answering questions.

Data Science Session Housekeeping

- The use of disrespectful language is prohibited in the questions, this is a supportive, learning environment for all - please engage accordingly. **(Fundamental British Values: Mutual Respect and Tolerance)**
- No question is daft or silly - **ask them!**
- There are **Q&A sessions** midway and at the end of the session, should you wish to ask any follow-up questions. Moderators are going to be answering questions as the session progresses as well.
- If you have any questions outside of this lecture, or that are not answered during this lecture, please do submit these for upcoming Academic Sessions. You can submit these questions here: **Questions**

Data Science Session Housekeeping cont.

- For all **non-academic questions**, please submit a query: **www.hyperiondev.com/support**
- Report a **safeguarding** incident: **www.hyperiondev.com/safeguardreporting**
- We would love your **feedback** on lectures: **Feedback on Lectures**

Skills Bootcamp
8-Week Progression Overview

Fulfil 4 Criteria to Graduation

✅ Criterion 1: Initial Requirements

Timeframe: First 2 Weeks
Guided Learning Hours (GLH): Minimum of 15 hours
Task Completion: First four tasks

Due Date: 24 March 2024

✅ Criterion 2: Mid-Course Progress

60 Guided Learning Hours

Data Science - **13 tasks**
Software Engineering - **13 tasks**
Web Development - **13 tasks**

Due Date: 28 April 2024

CoGrammar

Skills Bootcamp Progression Overview

✅ Criterion 3: Course Progress

Completion: All mandatory tasks, including Build Your Brand and resubmissions by study period end
Interview Invitation: Within 4 weeks post-course
Guided Learning Hours: Minimum of 112 hours by support end date (10.5 hours average, each week)

✅ Criterion 4: Demonstrating Employability

Final Job or Apprenticeship Outcome: Document within 12 weeks post-graduation
Relevance: Progression to employment or related opportunity

Datasets and DataFrames
April 2024

Learning objectives

Learn how to **read** and **manipulate data** with **Pandas**

- Python packages for data science: NumPy and Pandas
- Datasets & DataFrames
- Read data from different sources, select specific columns and rows in a DataFrame
- Apply built-in DataFrame methods, grouping operations
- Jupyter Notebook

Python packages for data science

NumPy

CoGrammar

Python packages for data science: NumPy

- **NumPy** - stands for **Num**erical **Py**thon

```
$ pip install numpy
```

- Python arrays differ from lists
  - Elements of same datatype
  - Can handle arithmetic operations
  - Preferred for larger chunks of data
  - Requires proper modules to perform operations on them

- Array oriented programming, NumPy has smaller memory consumption, better runtime, and ease of data manipulation

Using NumPy

```
import numpy as np
```

```
import numpy as np

#Define a list
distances = [1, 13.1, 26.2, 100]
print(type(distances))
print(distances)
#Output: <class 'list'>
#Output: [1, 13.1, 26.2, 100]

#Convert to numpy array
numpy_dist = np.array(distances)
print(type(numpy_dist))
print(numpy_dist)
#Output: <class 'numpy.ndarray'>
#Output: [  1.   13.1  26.2 100. ]
```

Using NumPy

```python
import numpy as np

#Define a list
distances = [1, 13.1, 26.2, 100]

#Convert to numpy array
numpy_dist = np.array(distances)

#Convert distances in miles to km
#Using numpy scalar multiplication
conversion = numpy_dist * 1.60934
print(conversion)
#Output: [1.60934, 21.082354, 42.164708, 160.934]
```

```python
#Using core Python

#Define a list
distances = [1, 13.1, 26.2, 100]

#Define an empty array to store km distances
conversion = []

#Using a for loop for conversion
for x in distances:
    conversion.append(x*1.60934)

print(conversion)
#Output: [1.60934, 21.082354, 42.164708, 160.934]
```

Python packages for data science

Pandas

CoGrammar

Pandas

- **Pandas**, built on NumPy, is a Python module that contains high-level data structures and tools designed for fast and easy data analysis.

```
$ pip install pandas
```

```
import pandas as pd
```

- Fundamental pandas data structures
  - Series (1-dimensional labelled array, can hold any data type)
  - DataFrame (2-dimensional)
  - Panel (pandas -> **pan**el **da**ta)

	Name

Datasets

CoGrammar

Datasets

- A dataset is a structured collection of information relevant to a specific investigation or project
- In data science, they provide the raw material for analysis and modeling. Understanding different dataset formats ensures you can work with data from various sources (databases, online repositories, etc.).
- With the help of Pandas DataFrames, we can effortlessly manipulate data to suit our needs.

DataFrames

CoGrammar

DataFrames

- A DataFrame is the way the Pandas library in Python represents tabular data. It's like a powerful *spreadsheet* within your code.

- Rows: Each row represents a single observation or data point (e.g., a person, a product, a transaction).

- Columns: Each column represents a variable or feature (e.g., height, price, date). Data within a column usually shares the same data type (numbers, text, etc.).

Pandas DataFrame

CoGrammar

Pandas DataFrame

- The pandas' library documentation defines a DataFrame as a "two-dimensional, size-mutable, with labelled rows and columns."

	color	director_name	num_critic_for_reviews	duration	...	actor_2_facebook_likes	imdb_score	aspect_ratio	movie_facebook_likes
0	Color	James Cameron	723.0	178.0	...	936.0	7.9	1.78	33000
1	Color	Gore Verbinski	302.0	169.0	...	5000.0	7.1	2.35	0
2	Color	Sam Mendes	602.0	148.0	...	393.0	6.8	2.35	85000
3	Color	Christopher Nolan	813.0	164.0	...	23000.0	8.5	2.35	164000
4	NaN	Doug Walker	NaN	NaN	...	12.0	7.1	NaN	0

Anatomy of a DataFrame

Pandas DataFrame

- Pandas provides functions like **pd.read_csv()**, **pd.read_excel(), pd.read_sql()**, to bring your data directly into your coding environment as DataFrames.

- This is where you start turning your raw data into something easily workable.

```
import pandas as pd
```

```
# url = 'https://raw.githubusercontent.com/mwaskom/seaborn-data/master/iris.csv'
# df = pd.read_csv(url)
from sklearn import datasets
iris = datasets.load_iris()
df = pd.DataFrame(iris.data, columns=iris.feature_names)
```

Exploring datasets

- **df.head(), df.tail()**: Peek at the top and bottom rows for initial understanding

```
df.head()
```

✓ 0.0s

	sepal length (cm)	sepal width (cm)	petal length (cm)	petal width (cm)	species
0	5.1	3.5	1.4	0.2	0
1	4.9	3.0	1.4	0.2	0
2	4.7	3.2	1.3	0.2	0
3	4.6	3.1	1.5	0.2	0
4	5.0	3.6	1.4	0.2	0

Exploring datasets

- **df.head(), df.tail()**: Peek at the top and bottom rows for initial understanding

```
df.tail()
```

✓ 0.0s

	sepal length (cm)	sepal width (cm)	petal length (cm)	petal width (cm)	species
145	6.7	3.0	5.2	2.3	2
146	6.3	2.5	5.0	1.9	2
147	6.5	3.0	5.2	2.0	2
148	6.2	3.4	5.4	2.3	2
149	5.9	3.0	5.1	1.8	2

Exploring datasets

- **df.shape:** Tells you the dimensions (rows, columns) of your data.

```
df.shape
```

✓ 0.0s

```
(150, 5)
```

Exploring datasets

- **df.info():** Gives the data types of each column, and if columns have missing values

```
df.info()
```

✓ 0.0s

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 150 entries, 0 to 149
Data columns (total 5 columns):
 #   Column             Non-Null Count  Dtype  
---  ------             --------------  -----  
 0   sepal length (cm)  150 non-null    float64
 1   sepal width (cm)   150 non-null    float64
 2   petal length (cm)  150 non-null    float64
 3   petal width (cm)   150 non-null    float64
 4   species            150 non-null    int64  
dtypes: float64(4), int64(1)
memory usage: 6.0 KB
```

CoGrammar

Exploring datasets

- **df.describe():** Quick summary statistics for numerical columns.

```
df.describe()
```

✓ 0.0s

Manipulating Data

CoGrammar

Manipulating Data

- **Selecting Columns**: You often work with a **subset of features.**
- Using df[['column1', 'column2']] gets you only specific columns.

```
df.columns
```
✓ 0.0s

```
Index(['sepal length (cm)', 'sepal width (cm)', 'petal length (cm)',
       'petal width (cm)', 'species'],
      dtype='object')
```

```
# Select specific columns
df_selected = df[['species', 'petal length (cm)', 'petal width (cm)']]
```
✓ 0.0s

CoGrammar

Manipulating Data

- **Filtering Rows:** Focus on specific subsets meeting certain conditions, e.g., df[df['species'] == 'setosa']

```
# Filter by flower species
df_setosa = df[df['species'] == 'setosa']
```

✓ 0.0s

Manipulating Data

- **Creating New Columns:** Derived features, e.g., calculating area from length and width.

```
# Create a new calculated column
df['petal area (cm^2)'] = df['petal length (cm)'] * df['petal width (cm)']
```

✓ 0.0s

Manipulating Data

- **Renaming/Dropping:** Improve clarity or get rid of unneeded data.

```
# Rename a column
df = df.rename(columns={'sepal length (cm)': 'sepal_len'})
```

✓ 0.0s

- Data manipulation gives you a **highly customized DataFrame** focused on your exact analysis needs.

Manipulating Data

- **Selecting Columns**: You often work with a **subset of features.**
- Using df[['column1', 'column2']] gets you only specific columns.

```
df.columns
```
✓ 0.0s

```
Index(['sepal length (cm)', 'sepal width (cm)', 'petal length (cm)',
       'petal width (cm)', 'species'],
      dtype='object')
```

```
# Select specific columns
df_selected = df[['species', 'petal length (cm)', 'petal width (cm)']]
```
✓ 0.0s

CoGrammar

Built-in Methods

- Pandas offers a toolbox of functions for calculations:
  - **mean()** - Computes the mean for each column.
  - **min()** - Computes the minimum for each column.
  - **max()** - Computes the maximum for each column.
  - **std()** - Computes the standard deviation for each column.
  - **var()** - Computes the variance for each column.
  - **unique()** - Computes the number of unique values in each column.

- This is the start of understanding the characteristics of your data.

Grouping and Aggregation

- df.groupby(): Divide your data **based on categories** in a column (e.g., group by species).

```
print(df['petal area (cm^2)'].mean())
print(df['species'].nunique())
print(df.groupby('species')['petal length (cm)'].std())
```

✓ 0.0s

```
5.794066666666667
3
species
0    0.173664
1    0.469911
2    0.551895
Name: petal length (cm), dtype: float64
```

CoGrammar

Grouping and Aggregation

- **.agg()**: Apply calculations within each group (e.g., average length, maximum width).

```
df.groupby('species').agg(
    mean_petal_length=('petal length (cm)', 'mean'),
    max_sepal_width=('sepal width (cm)', 'max')
)
```

✓ 0.0s

species	mean_petal_length	max_sepal_width
0	1.462	4.4
1	4.260	3.4
2	5.552	3.8

CoGrammar

Jupyter Notebook

CoGrammar

Jupyter Notebook

- An interactive environment perfect for data science work. They let you combine code, the results of the code (output), and explanatory text (like in a scientific report).

- This fosters clear data exploration and storytelling, all in one place

Installation

```
$ pip install jupyter
```

Running

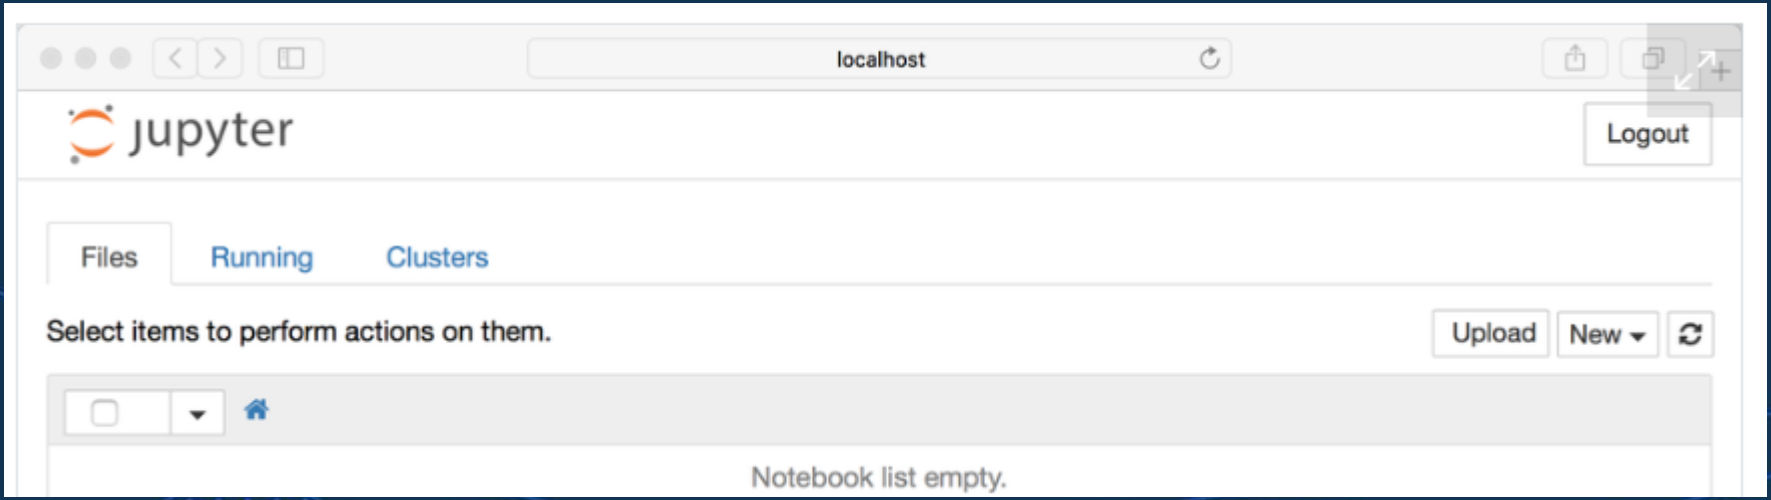
```
$ jupyter notebook
```

```
$ python -m notebook
```

CoGrammar

Jupyter Notebook

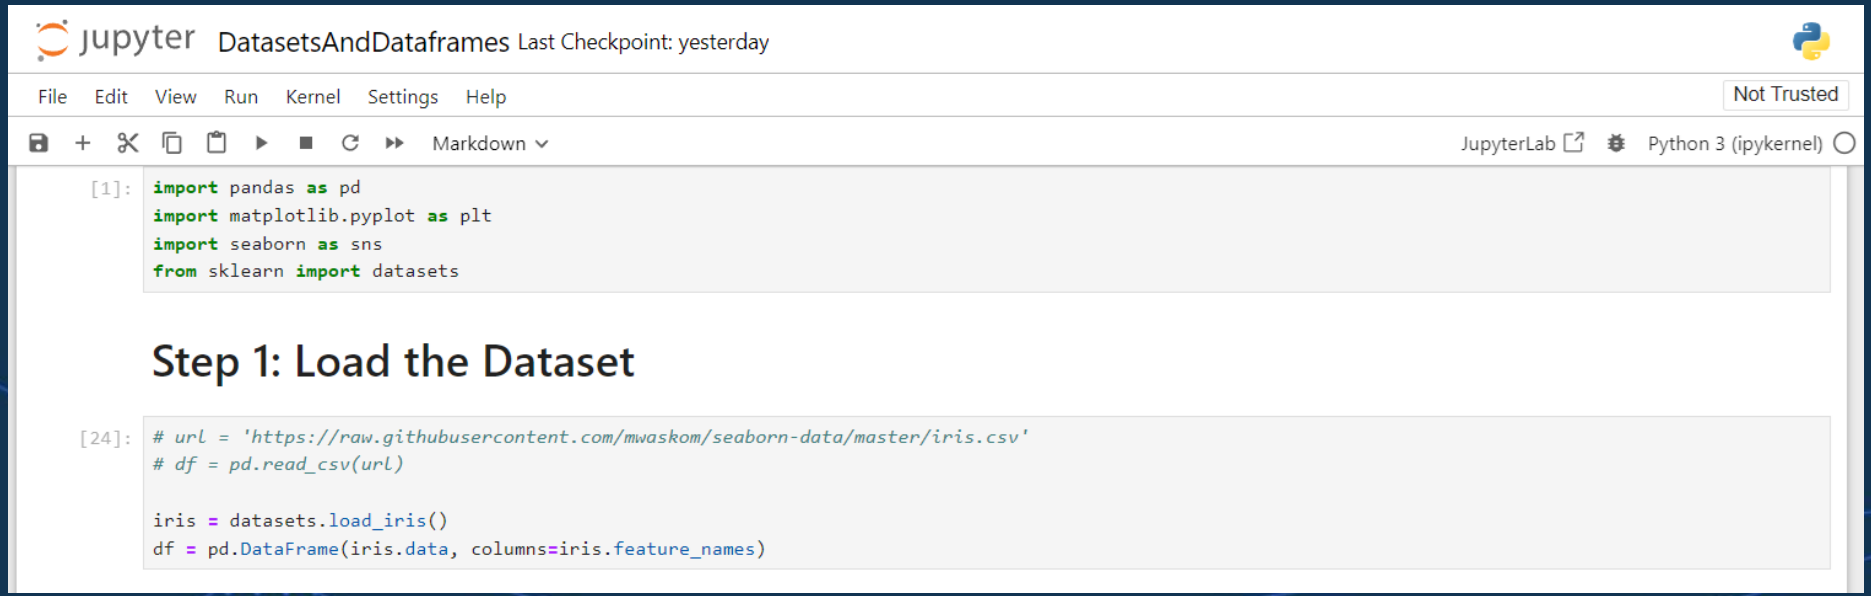
Starting the Jupyter Notebook Server, default browser goes to the URL http://localhost:8888/tree



CoGrammar

Jupyter Notebook

Creating, naming notebook, code, markdown



CoGrammar

Next Lecture

Data visualisation

CoGrammar

Data Visualisation

- There is a whole lecture dedicated to this, libraries like **Matplotlib** and **Seaborn** make visually exploring data easy.
- **Plots (scatter plots, histograms, etc.)** rapidly uncover relationships and distributions that are less clear from tables of numbers.
- Some good examples are in the **Seaborn Gallery**.
