Welcome to the CoGrammar Recursion and Object-Orientated Programming Lecture

The session will start shortly...

Questions? Drop them in the chat. We'll have dedicated moderators answering questions.

Coding Interview Workshop Housekeeping

- The use of disrespectful language is prohibited in the questions, this is a supportive, learning environment for all - please engage accordingly.
 (Fundamental British Values: Mutual Respect and Tolerance)
- No question is daft or silly ask them!
- There are Q&A sessions midway and at the end of the session, should you
 wish to ask any follow-up questions. Moderators are going to be
 answering questions as the session progresses as well.
- If you have any questions outside of this lecture, or that are not answered during this lecture, please do submit these for upcoming Academic Sessions. You can submit these questions here: <u>Questions</u>

Coding Interview Workshop Housekeeping cont.

- For all non-academic questions, please submit a query:
 www.hyperiondev.com/support
- Report a safeguarding incident:
 <u>www.hyperiondev.com/safeguardreporting</u>
- We would love your feedback on lectures: Feedback on Lectures

Skills Bootcamp 8-Week Progression Overview

Fulfil 4 Criteria to Graduation

Criterion 1: Initial Requirements

Timeframe: First 2 Weeks
Guided Learning Hours (GLH):
Minimum of 15 hours
Task Completion: First four tasks

Due Date: 24 March 2024

Criterion 2: Mid-Course Progress

60 Guided Learning Hours

Data Science - **13 tasks** Software Engineering - **13 tasks** Web Development - **13 tasks**

Due Date: 28 April 2024

Skills Bootcamp Progression Overview

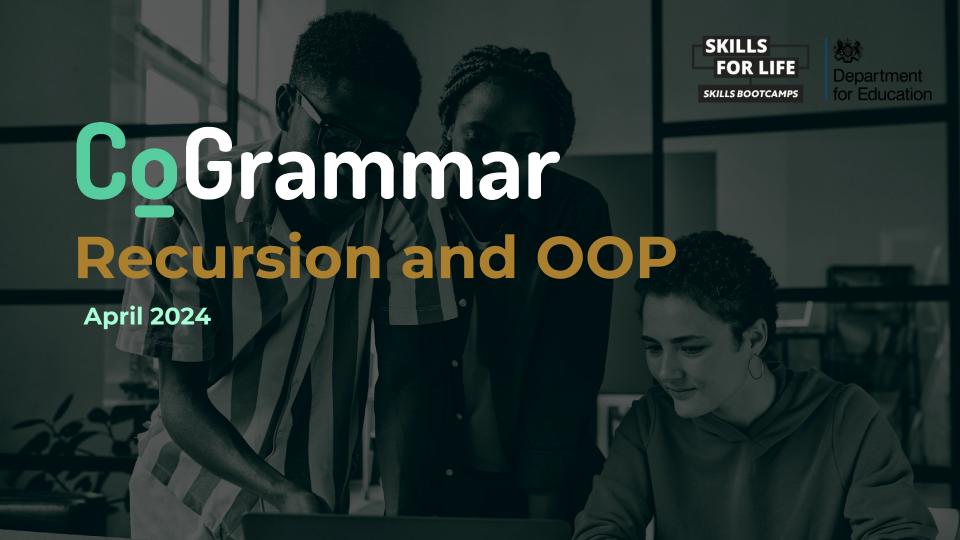

Criterion 3: Course Progress

Completion: All mandatory tasks, including Build Your Brand and resubmissions by study period end Interview Invitation: Within 4 weeks post-course Guided Learning Hours: Minimum of 112 hours by support end date (10.5 hours average, each week)

Criterion 4: Demonstrating Employability

Final Job or Apprenticeship
Outcome: Document within 12
weeks post-graduation
Relevance: Progression to
employment or related
opportunity

Learning Objectives

- Understand and apply the concept of recursion in Python and JavaScript, including base cases and recursive steps for problem-solving.
- Identify and resolve common issues associated with recursion, such as stack overflows, by optimizing recursive functions or using iterative solutions.
- Explain the principles of object-oriented programming (OOP), including encapsulation, inheritance, and polymorphism, and how they facilitate code reuse and modularity.

Learning Objectives

- Implement classes and objects in Python and JavaScript, demonstrating the use of constructors, methods, and attributes.
- Apply runtime polymorphism in OOP through method overriding and interface implementation to enable dynamic method dispatch.

A method of solving a computational problem where the solution depends on solutions to smaller instances of the same problem

Consider the following problem:

Imagine you are back in school and you are helping a new student figure out the ropes of the classroom. A note passes by and you decide to explain the note passing protocol to the new student.

- We could explain the process to the student as follows:
 - 1. Take the note from the student behind you.
 - 2. Check the name on the note:
 - a. If the name on the note is your name, open the note.
 - b. If the name on the note is not your name:
 - i. Pass the note on to the person in front of you.
 - ii. Repeat steps 1 and 2.

We can convert these instructions to code using an iterative approach:

```
students = ["Zahra", "Moumita", "Anri", "Julien"]
def passNote (destination):
    found = False
    i = 0
    while (not found):
        if (i == len(students)):
            return "Destination not found"
        elif (destination == students[i]):
            found = True
            return "Note delivered"
        i += 1
```

```
let students = ["Zahra", "Moumita", "Anri", "Julien"];
function passNote (destination){
    let found = False;
   i = 0;
   while (!found){
       if (i == len(students))
            return "Destination not found";
        else if (destination == students[i]){
            found = True;
            return "Note delivered";
        i += 1;
```

Alternatively, we could use recursion, which involves calling a function within itself:

```
students = ["Zahra", "Moumita", "Anri", "Julien"]

def passNote (destination, location):
    if (location == len(students)):
        return "Destination not found"
    elif (destination == students[location]):
        return "Note delivered!"
    else:
        return passNote(destination, location + 1)
```

```
let students = ["Zahra", "Moumita", "Anri", "Julien"];
function passNote (destination, location) {
   if (location == len(students))
      return "Destination not found";
   else if (destination == students[location])
      return "Note delivered!";
   else
      return passNote(destination, location + 1);
}
```

- A recursive function has these two components:
 - Base case: A condition that stops the recursive calls.
 - Recursive step: The step where the function calls itself with a smaller input.

Stack Overflow

Occurs when the number of function calls added to the stack is more than the stack's maximum limit.

- In our previous lecture, we looked at the Stack and the Heap.
- We saw that function calls, are added to the stack and are kept their until the function has returned or completed execution.
- Recursive functions that are **too deep** or that **have no base case** can result in stack overflow.

```
function overflow () {
   return overflow (); }
```

Stack Overflow

- In cases where we do have a defined base case, the following methods can be used to prevent stack overflow:
 - > Limit the depth of recursion: keep track of the number of recursive calls and stop the function once a maximum is reached.
 - > **Tail recursion**: in our recursive function, we ensure that the recursive call is the last statement executed.
 - This optimization **does not** work for Python and for many JavaScript compilers, since it does not help the call stack.
 - Convert to an iterative solution: all recursive solutions can be converted into iterative solutions, which may be more complex

Stack Overflow

Consider the following code, how could we prevent possible cases of stack overflow:

```
def sum (n):
    if (n <= 0):
        return 0
    else:
        return n + sum (n-1)</pre>
```

```
function sum (n){
    if (n <= 0)
        return 0;
    else
        return n + sum (n-1);
}</pre>
```

Let's Breathe!

Let's take a small break before moving on to the next topic.

A programming paradigm based on the concept of objects which store data in the form of attributes and code in the form of methods.

- Consider a scenario where you may want to store the information of several students in a class.
 - Each student has multiple sets of data pertaining to them.
 - > There are some functions that we may need to perform for each students which involves the data pertaining to them.
- We could implement this using multiple arrays/lists, dictionaries or maps to store all the data but this could become confusing

- What if we could define a new data type: "Student"
- We can do this using **objects** in JavaScript and Python.
- In order to create objects, we create a "template" or "blueprint" for the object using classes.
- In this blueprint, we outline the different attributes that the object has and the different methods defined for the object.
- In JavaScript, objects can be created using object literal notation and class notation. For simplicity, we will only be using class notation.

- We use the class keyword to create a new class, followed by the name of the class.
- We use a constructor function to define anything that needs to take place when the object is first instantiated.
 - > This includes any **attributes** that need to be defined, which we store using the **this (JS)** keyword or **self (Python)** parameter.
 - In Python, **self** has to be passed into every function in the class as the first parameter but does not have to be included when the function is actually called.

```
class Student:
    def __init__(self, name, age, grade):
        self.name = name
        self.age = age
        self.grade = grade
```

```
class Student {
    constructor (name, age, grade) {
        this.name = name;
        this.age = age;
        this.grade = grade;
    }
}
```

- We define methods in our classes the same way that we would define functions.
- To reference any of the class' attributes we use this or self.

```
def sayMyName (self):
    print("Hi, my name is " + self.name)
```

```
sayMyName () {
   console.log(`Hi, my name is ${this.name}`);
}
```

- To create a new object of a certain class, we use the name of the object and pass in any parameters needed by constructor.
- lacktriangle We access the attributes and methods of the object using a "lacktriangle"

```
zahra = <u>Student</u>("Zahra", 23, 12)
print(zahra.name)
```

```
let zahra = new <u>Student("Zahra", 23, 12);</u>
console.log(zahra.name);
```

Encapsulation

A fundamental concept in OOP which involves hiding the internal details of an object and controlling how data within the object can be manipulated.

- Instead of allowing for attributes to be accessed directly, we make our attributes private and create getter and setter methods which can be used to modify and access the attributes.
- We use a "_" in front of the name of an attribute to change the visibility of the attribute.

Encapsulation

```
class User:
   def __init__(self, username, password, accessCode):
        self.username = username
        self._password = password
        self._accessCode = accessCode
   def getAccess(self, username, password):
        if (self.username == username):
            if (self._password == password):
                return self._accessCode
            else:
                return "Incorrect Password"
        else:
            return "Incorrect Username"
```

Inheritance

A mechanism where a new, child class inherits attributes and methods from an existing, parent class.

- Inheritance allows for classes to be created based on an existing class, which shares attributes and methods.
- A child class can have its own methods and attributes as well.
- In JavaScript, this is implemented using prototypes, all objects are said to have a prototype and attribute and method calls are passed through the prototype chain, until it is found.
- In Python, the parent class is passed as a parameter to the child class.
- We use the super keyword to access the parent class within the child class.

Inheritance

```
class Animal:
    def __init__(self, name):
        self.name = name
    def sayHi (self):
        print("Hi, I am a " + self.name)
class Mammal (Animal):
    def __init__(self, name, gestationPeriod):
        super().__init__(name)
        self.gestation = gestationPeriod
mammal = Mammal("Zebra", 12)
mammal.sayHi()
```

```
class Animal {
    constructor (name) {
        this.name = name;
    sayHi () {
        console.log(`Hi, I am a ${this.name}`);
class Mammal extends Animal {
    constructor (name, gestationPeriod){
        super(name)
        this gestation = gestationPeriod
let mammal = new Mammal("Zebra", 12);
mammal.sayHi();
```

Polymorphism

A concept that allows objects of different classes to be treated as objects of a common interface class.

- Polymorphism allows for multiple objects of different classes to have methods with the same name.
- It also allows for us to override methods from parent classes in a child class.

```
# Create an interface by not defining all the methods
class Vehicle:
    def __init__ (self, make, model, year):
        self.make = make
        self.model = model
        self.year = year

    def letsDrive (self):
        pass
```

```
// Interfaces don't exist in JavaScript
// All methods can be overridden and all functions are polymorphic
class Vehicle {
    constructor (make, model, year) {
        this.make = make;
        this.model = model;
        this.year = year;
    }
    letsDrive () {
        console.log("Chug chhuug");
    }
}
```

Polymorphism

```
class Motorbike (Vehicle):
    def letsDrive (self):
        print("Zooom zooom")
class Car (Vehicle):
    def letsDrive (self):
        print("Vroom vrooooom")
class Truck (Vehicle):
    def letsDrive (self):
        print("Brruuum brrruuuum")
motorbike = Motorbike("Yamaha", "Road Star", 2004)
car = Car("Volkswagen", "Polo", 2006)
truck = Truck("Ford", "F-150", 2021)
vehicles = [motorbike, car, truck]
for vehicle in vehicles:
    vehicle.letsDrive()
```

```
class Motorbike extends Vehicle {
    letsDrive () { console.log("Zooom zooom"); }
class Car extends Vehicle {
    letsDrive () { console.log("Vroom vrooooom"); }
class Truck extends Vehicle {
    letsDrive () { console.log("Brruuum brrruuuum"); }
let motorbike = new Motorbike("Yamaha", "Road Star", 2004);
let car = new Car("Volkswagen", "Polo", 2006);
let truck = new Truck("Ford", "F-150", 2021);
let vehicles = [motorbike, car, truck];
vehicles.forEach((vehicle) => vehicle.letsDrive());
```

Portfolio Assignment: SE

Object-Oriented Programming Design Patterns Implementation

Objective: Implement a set of design patterns using object-oriented programming principles in Python. This project will demonstrate your understanding of OOP and design patterns.

Portfolio Assignment: SE

Requirements:

- Choose at least three design patterns from the following: Singleton, Factory Method, Observer, Strategy, or Composite.
- > Implement the selected design patterns in Python, focusing on clean and modular code.
- > Integrate the design patterns into a sample application (e.g., a simple game, a data processing tool).
- Provide documentation for each implemented design pattern, explaining its purpose and usage.
- > Test the sample application to verify that the design patterns are functioning as expected.

Portfolio Assignment: DS

Recursive Neural Network for Text Classification

Objective: Implement a recursive neural network (RNN) in Python for text classification tasks. This project will showcase your understanding of recursion, OOP, and natural language processing (NLP) techniques.

Portfolio Assignment: DS

Requirements:

- Implement a recursive neural network using Python, utilising libraries such as TensorFlow or PyTorch.
- Use a publicly available text classification dataset (e.g., sentiment analysis, topic classification).
- Use OOP principles to organise the code and represent the neural network architecture.
- Train the RNN model on the dataset and evaluate its performance using appropriate metrics.
- Provide detailed documentation of the implementation, including the dataset used, model architecture, training process, and evaluation results.

Portfolio Assignment: WD

Interactive Recursive Tree Visualizer

Objective: Create a web application that allows users to visualise and interact with recursive tree structures. This project will demonstrate your understanding of recursion and frontend development skills.

Portfolio Assignment: WD

Requirements:

- > Implement a recursive function in JavaScript to generate tree structures.
- > Use HTML, CSS, and JavaScript to create an interactive visualization of the generated trees.
- Allow users to modify the tree structure (e.g., add/remove branches) through user interactions.
- Utilize OOP principles in JavaScript to represent tree nodes as objects.
- Update the visualization dynamically as users modify the tree structure.
- Provide clear documentation on how to use the application.
